# Member of the PTC partner network

The ASAP Group is an established member of the PTC Partner Network. As a preferred partner in the DACH region, ASAP offers integrated services in relation to the application lifecycle management (ALM) tool Codebeamer, from the initial idea to implementation and beyond.
It covers the full spectrum of activities, from consultancy prior to tool implementation through to development, integration, operationalisation and application in customer projects. HCLTech supplements this portfolio as a global system integrator (GSI) for various PTC products.

# get in touch

Any questions or projects that you would like to discuss? We'd love to share ideas and explore synergies with you.

# Codebeamer

# From ideas to implementation

## Application & development

ASAP assembles cross-functional teams to take account of organisations' individual circumstances and handle the complexity of development projects. Our application and development experts provide support with tool configuration and development and also help to produce extensions and adapters. Their remit also includes developing data models and templates as well as producing tool automations. ASAP also supports the development of help tools and reporting pipelines.

### Process & method development

Another focus of our Codebeamer services is process development and operationalisation. ASAP always takes A-SPICE and ISO standards into account when consulting on suitable methods for various areas, including:

- Requirements engineering
- Software development
- Test management
- Error management
- Support processes
- Management processes

## Roll-out & change communication

Roll-out and change communication are crucial factors in the success of Codebeamer projects. With this in mind, ASAP provides complete project set-up services, including initial project creation and configuration. This also includes establishing project structures and change configurations. Our services in this area also include developing overarching concepts, creating POCs and MVPs, and establishing and coordinating schedules.

## Project data migration

When it comes to migrating project data, ASAP defines the required data migration process before assisting with preparations and facilitating the migration itself. We can migrate projects from many different tools, including:

- Doors – Codebeamer
- Excel – Codebeamer
- Polarion – Codebeamer
- Customer-specific solutions – Codebeamer ("ALM migration")

For a seamless project data migration process, ASAP offers and develops appropriate automation solutions and scripts.

## Operational application

ASAP also determines requirements, develops test cases and produces reports as well as monitoring and updating the status of created elements. In this context, ASAP ensures the traceability of all elements within the system and produces all relevant data and reports.

## Coaching & customer support

As the final element of our integrated services, ASAP goes beyond general user support by providing training to equip users with the skills they need. In addition, our experts deploy customer-specific tool chains, offer introductions to process compliance and develop solutions to automate administrative tasks.

### PAK & Codebeamer

ASAP relies on its PAK automation solution to implement all Codebeamer projects as swiftly and flexibly as possible. This framework for individual, reusable automations is a valuable supplement to conventional DevOps methods. Using PAK, ASAP defines the methods in individual sub-disciplines and creates interfaces between Codebeamer and the relevant development tools.
